

Dear Sony Alpha product management team,

As a photo and video enthusiast I am very delighted about the set of my Sony imaging products (RX100, a5100, a6000). Especially image quality and feature set (software functionality) is outstanding at Sony cameras at this moment – congratulations!

However, when moving from my compact camera RX100 towards the Sony Alpha system with interchangeable lenses, I am struggling with dust issues on the sensor regularly. My personal opinion: an open sensor when changing lenses is not a “top of the edge” technology as I would expect with these products! Although not being a design engineer, I would think there are solutions for this problem (lamellar closure, glass, electro-static, ventilation, etc.).

So, as a bottom line: the high quality of these products is significantly impacted by the fact of dirty sensors – which is unavoidable today!

Please find an adequate solution to make your portfolio outstanding.

Thanks a lot & Kind Regards

*Thomas Harreus / Germany*
